*I just started off reading this article pdf. It really is simplistic but shocks in the fifty percent of your ebook. You will not truly feel monotony at any time of the time (that's what catalogues are for about when you request me).*

Excerpt: . . . be taken to be the one giving the least energy loss under service conditions provided it did not develop some undesirable characteristic such as acidity or drying out rapidly to a gum, etc., when in use. There are two radically different classes of service to be considered, namely, lubrication of bearings and the lubrication of engine cylinders. The conditions in bearings are simpler and easier to meet. The temperatures are usually moderate and the direction of motion, the speed and the pressure constant. For these reasons a number of machines have been built to measure the friction in bearings. Professor Thurston's apparatus in which a split bearing is clamped on the shaft by spring pressure, thus giving an oil film thickness that depends on the constants of the oil as in railroad car bearings and Professor Stribeck's in which a solid-shell ring-oiled bearing having an average oil film thickness that is constant (being determined by the difference in diameter of journal and bearing) a type very generally employed for machines, are particularly deserving of mention. 1 Thurston. Friction and Lost Work. John Wiley and Sons. In engine cylinders the temperatures are high and subject to a wide cyclic variation, the lubricant is also subject to the high and varying pressure of the steam or gas as well as the pressure between the packing rings and cylinder walls; the motion is reciprocating and it is difficult to get the lubricant to the rubbing surfaces...
