CHAPTER VI REACTIONS OF THE METALS OF GROUP Mb Manganese, Mn Dry Reactions. --Manganese compounds, when heated in a borax bead in the oxidising flame, impart to the bead a violet or lilac colour. When heated in the reducing flame, the bead again becomes colourless. A more characteristic reaction is to fuse the manganese compound with KH0 , or with Na03 and a little KN03 or KC103 upon a piece of platinum foil; the manganese undergoes oxidation, and a deep green-coloured mass is obtained, consisting of manganates of the alkali metals-- Mn02Na2C030 (from KC103 or KN03) Na2Mn04C02 Wet Reactions. --Of the common manganous¹ salts, the chloride, MnCl2 , 4H20 , and the sulphate, MnS04 , 5H20 , are soluble in water. In the crystallised state they have all a pink colour. Manganous salts which are soluble in water do not undergo atmospheric oxidation. NH4HO , KH0 , and NaH0 produce a white precipitate of manganous hydroxide, Mn(H0)2 . Insoluble in excess of the reagent, the precipitate quickly absorbs oxygen, and is converted into hydrated manganic oxide, Mn2O3 , H2O , having a brown colour. Freshly precipitated Mn(H0)2 , while still white, is soluble in NH4C1 ; therefore in the presence of NH4C1 , manganous hydroxide is not precipitated by NH4H0 , and only incompletely by KH0 or NaH0 . The ammoniacal solution of the double chloride, however, is capable of absorbing oxygen just as the precipitated Mn(H02) 1 The manganic salts are extremely unstable in solution, and do not exist under the ordinary conditions of analysis. does, and the liquid quickly...
